# Chapter Description

- **Aims**

To understand the properties of different types ceramic materials.

- **Expected Outcomes**

- Student able to classify the types of ceramic materials.
- Student able to describe the different properties of traditional and advanced ceramic materials.

- **References**

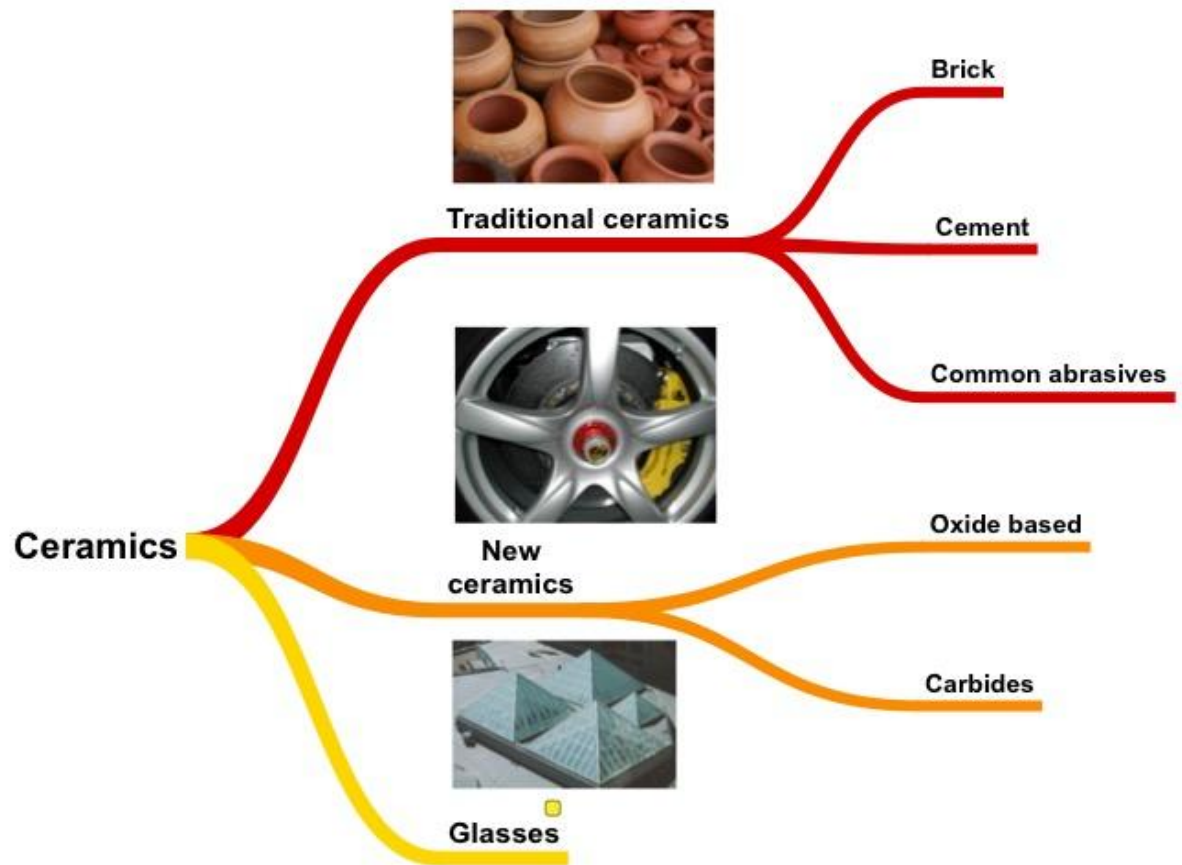

1. William D. Callister and David G. Rethwisch. Materials science and engineering: An Introduction, 9<sup>th</sup> Ed. Wiley, 2014.

# Introduction of ceramic

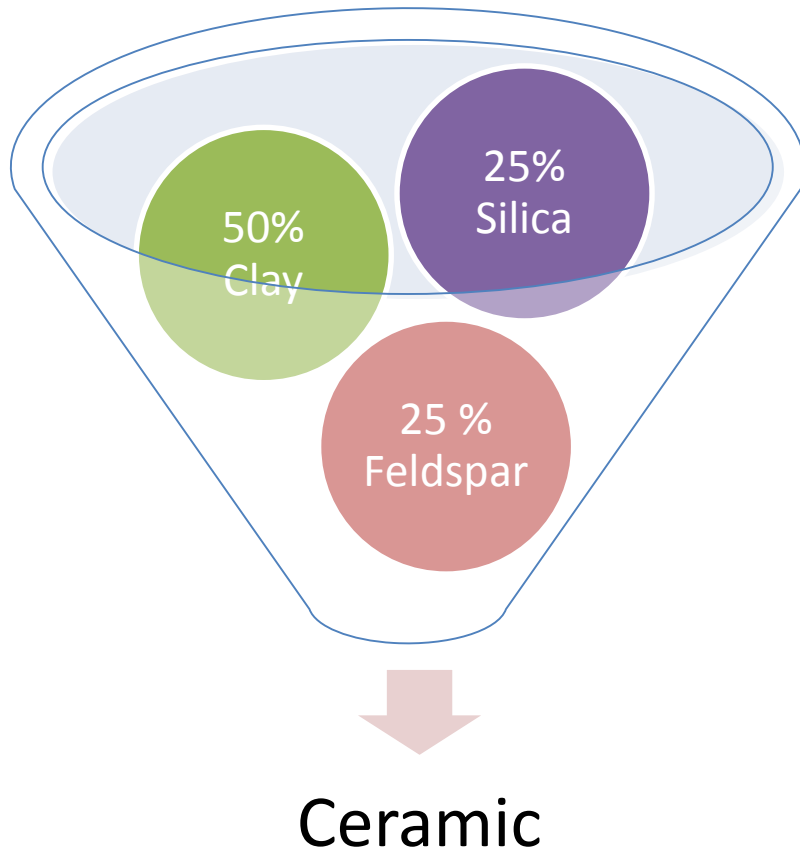

**Definition:** Inorganic, nonmetallic materials that consist of metallic and nonmetallic elements bonded together primarily by ionic and/ or covalent bonds.

**Properties and characteristic:**

- Hard and brittle with low toughness and ductility.
- Usually good electrical and thermal insulators
- High melting temperatures and high chemical stability

# Traditional ceramic

## Feldspar (Fluxing agent)

- Bond the refractory component
- Makes a glass when the ceramic mix was fired

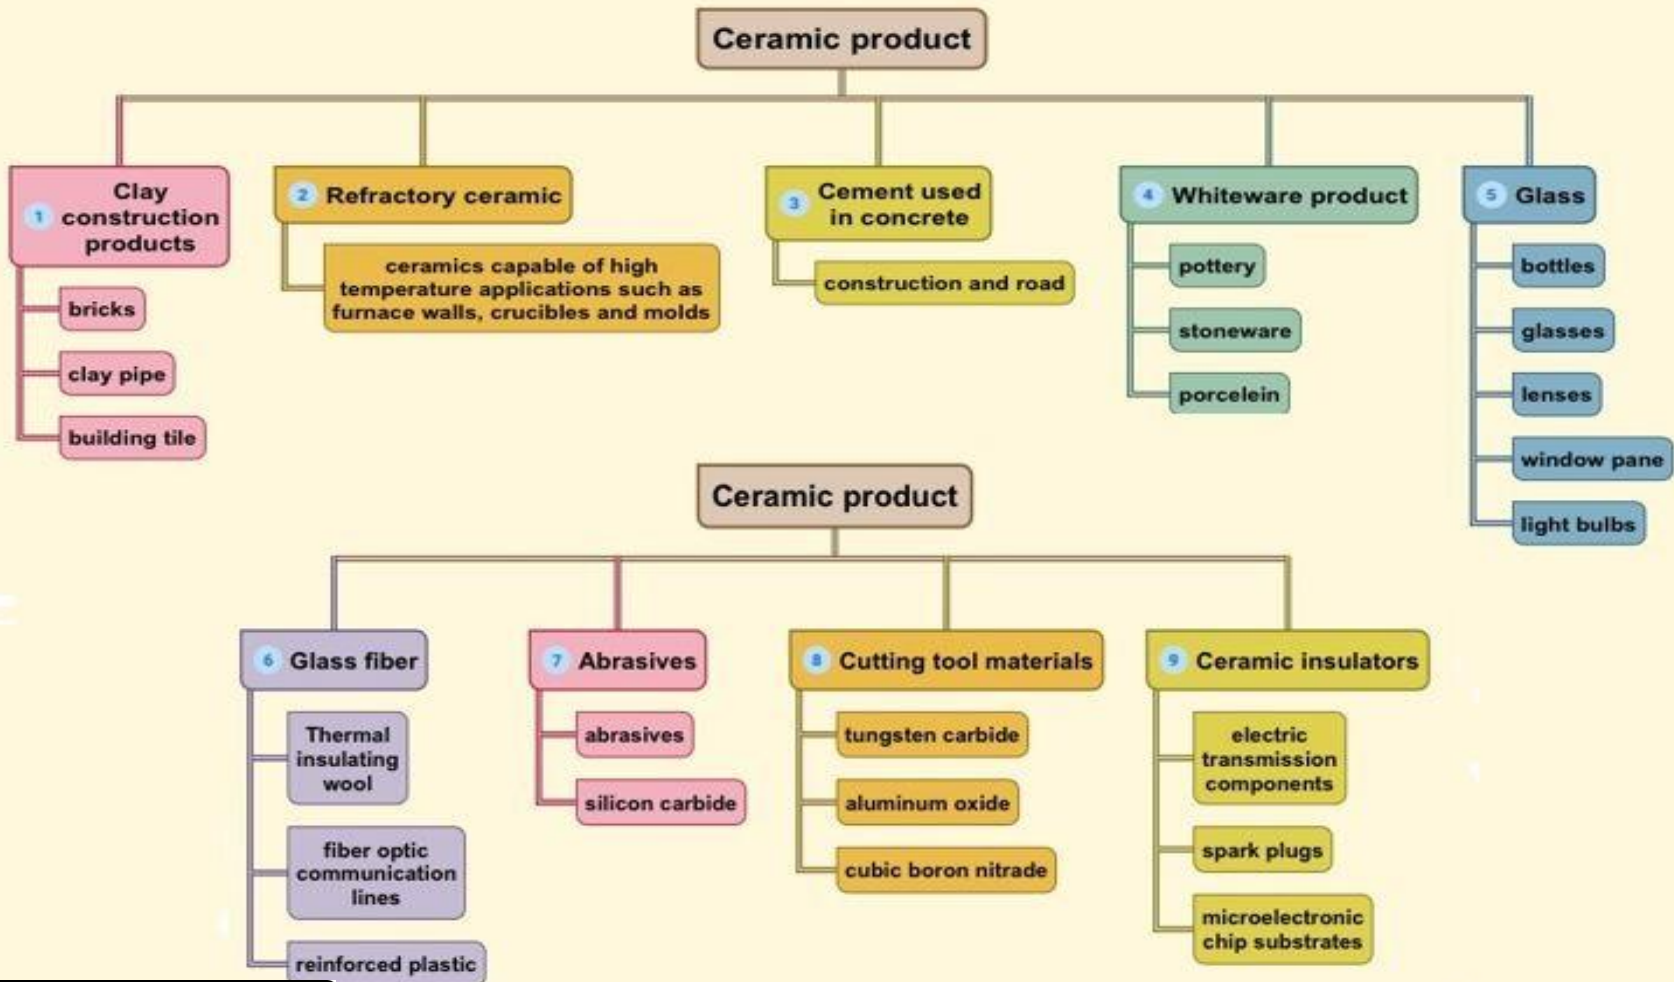

## Clay

- Constitute the major body material
- provides workability of the material before firing hardens it

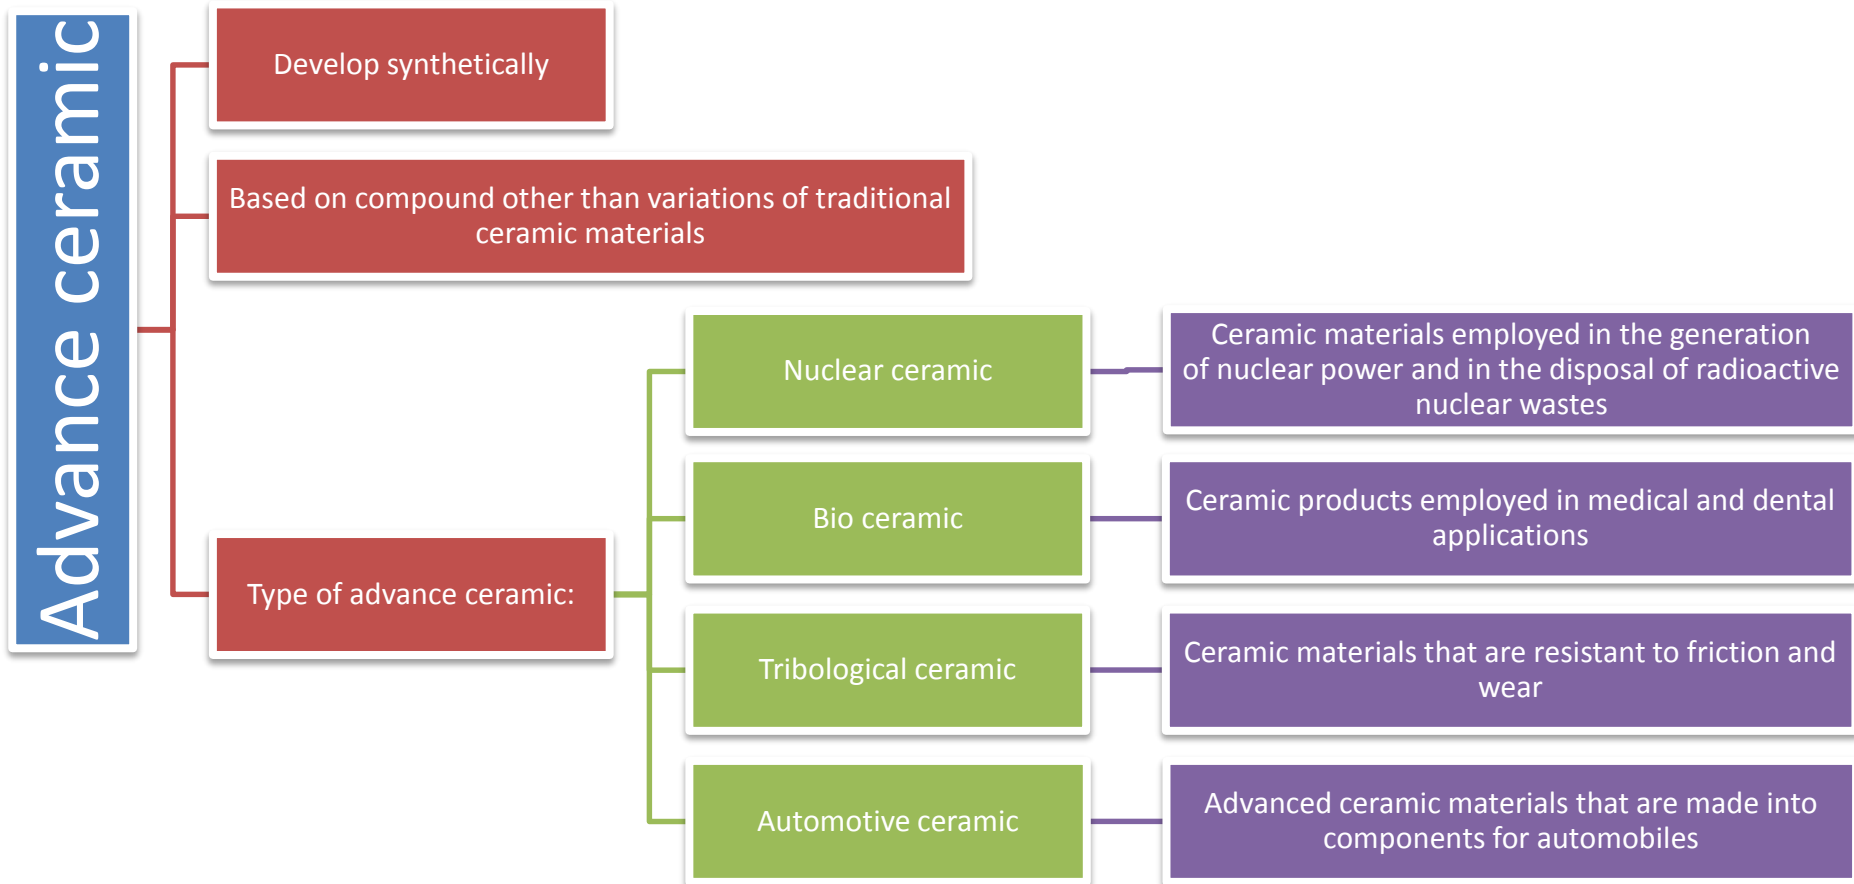

## Silica/Filler

- Refractory component

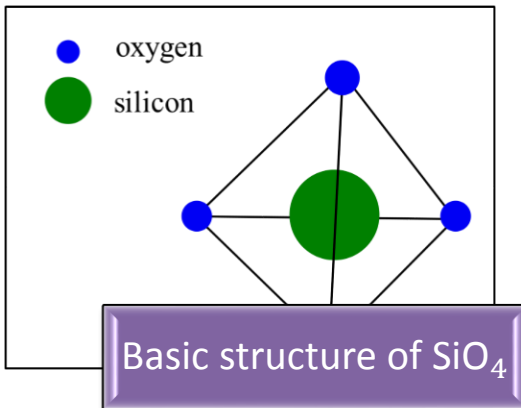

# Traditional Ceramic

# New / Advanced Ceramic

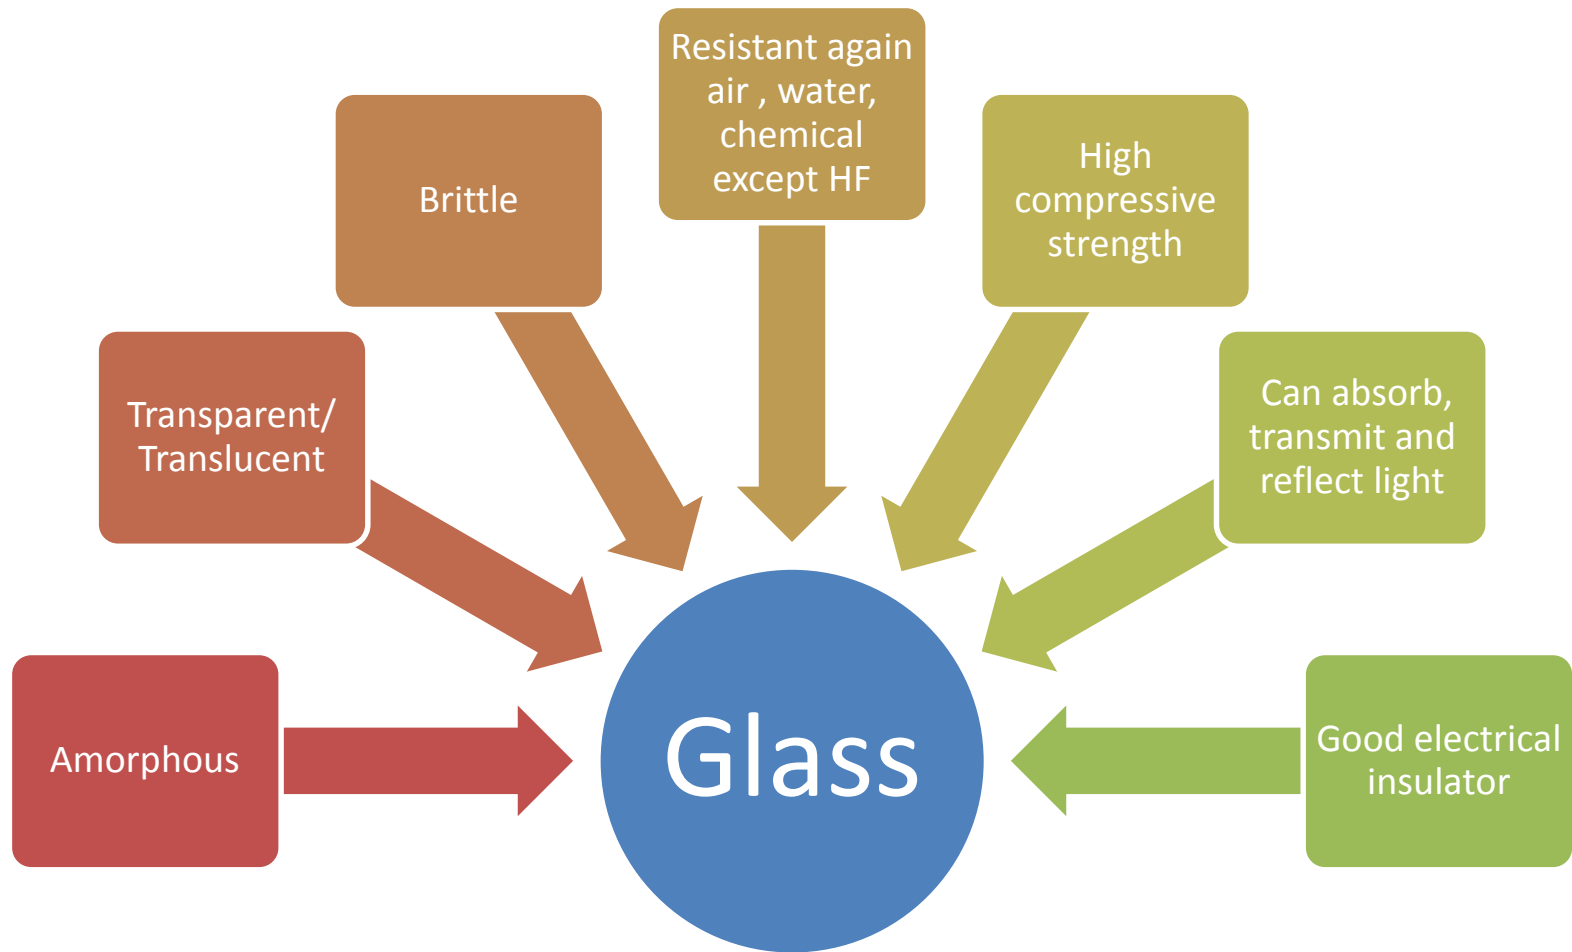

# Glass

- Glass is noncrystalline (**amorphous**)
- Fused silica is  $\text{SiO}_2$  to which no impurities have been added
  - Other common glasses contain impurity ions such as  $\text{Na}^+$ ,  $\text{Ca}^{2+}$ ,  $\text{Al}^{3+}$ , and  $\text{B}^3$

# Properties of Glass

# Type of Glass

Type of glasses	Composition	Advantages and disadvantages
Fused silica glass, vitreous silica glass	100% Silica	<ul style="list-style-type: none"> <li>low thermal expansion, hard and resist high temperature</li> <li>resist against weathering</li> </ul>
Soda-lime-silica, window glass	silica 72% + sodium oxide ( $\text{Na}_2\text{O}$ ) 14.2% + magnesia ( $\text{MgO}$ ) 2.5% + lime ( $\text{CaO}$ ) 10.0% + alumina ( $\text{Al}_2\text{O}_3$ ) 0.6%.	<ul style="list-style-type: none"> <li>transparent, easily formed</li> <li>has a high thermal expansion and poor resistance to heat</li> </ul>
Sodium borosilicate glass (Pyrex)	silica 81% + boric oxide ( $\text{B}_2\text{O}_3$ ) 12% + soda ( $\text{Na}_2\text{O}$ ) 4.5% + alumina ( $\text{Al}_2\text{O}_3$ ) 2.0%.	<ul style="list-style-type: none"> <li>Stands heat expansion much better than window glass.</li> <li>low coefficients of thermal expansion</li> </ul>
Lead-oxide glass, crystal glass	silica 59% + soda ( $\text{Na}_2\text{O}$ ) 2.0% + lead oxide ( $\text{PbO}$ ) 25% + potassium oxide ( $\text{K}_2\text{O}$ ) 12% + alumina 0.4% + zinc oxide ( $\text{ZnO}$ ) 1.5%.	<ul style="list-style-type: none"> <li>high refractive index.</li> <li>cannot stand heating very well</li> </ul>
Aluminosilicate	20% aluminium oxide (alumina- $\text{Al}_2\text{O}_3$ )	<ul style="list-style-type: none"> <li>able to withstand high temperatures and thermal shock</li> </ul>
Oxide glass	alumina 90% + germanium oxide ( $\text{GeO}_2$ ) 10%.	<ul style="list-style-type: none"> <li>Extremely clear glass</li> </ul>

# Ceramic Fabrication Methods

## Glass forming

- Pressing
- Blowing
- Drawing
- Fiber forming

## Particulate forming

- Powder pressing: Hot; Uniaxial; Isostatic
- Hydro plastic forming
- Slip casting
- Tape casting

## Cementation

# Glass forming: Blow and blow method

Gob  
dropped in  
blank mold

Neck  
formed

Blank  
blown

Blank  
shape

Blank  
transferred  
to blow  
mould

Final shape  
blown

Finished  
bottle

# Particulate forming (Slip casting)

## Preparing slurry

- Mix clay and dispersing agent into water

Formation of cast

Partial drying

Final drying

Fill in Mold

Draining

Plugging and separating
