Slump Test

Reinforced Concrete

ii. Concrete Grade

- The numerical value of the characteristic strength at 28 days in N/mm²
- Compressive Strength

Grade of Concrete	28-day Strength (N/mm ²)	Cube Strength at 7 Days (N/mm ²)	Average Cube Strength at 28 Days (N/mm ²)
20	20.0	14	20.0
25	25.0	17	25.0
30	30.0	20	30.0
40	40.0	27	40.0

Classification of Concrete Mixes

Characteristic Strength of Steel Reinforcement

Type	Nominal Sizes (mm)	Specified Characteristic Strength, f_y (N/mm ²)
Hot rolled grade 250	All sizes	250
Hot rolled grade 460	All sizes	460
Cold worked	All sizes	460
Hard drawn steel wire	Up to and including 12	485

Grade of Concrete and Mixed

Grade of Concrete	Cement/Sand/Aggregate Ratio
15	1:3:6
20	1:2:4
25	1:1.5:3
30	1:1:2

Quiz

Calculation of required materials for 1m³ concrete, where the mixing proportion is 1:2:4.

Solution:

Dry volume = $1 \times 1.45 = 1.45$ (increase in dry volume of concrete is considered to be 45%)

Cement = $1.45 / (1+2+4) = 0.207\text{m}^3 \times 1470$ (density of cement) = 304.29 kg

Sand = $(1.45 \times 2) / (1+2+4) = 0.414\text{m}^3 \times 1350$ (density of sand) = 558.9 kg

Coarse Aggregate = $(1.45 \times 4) / (1+2+4) = 0.828\text{m}^3 \times 1300$ (density of aggregate) = 1076.4 kg
