Kinematics

by Farah Hanani binti Zulkifli

<http://ocw.ump.edu.my/enrol/index.php?id=461>

Chapter Description

Expected outcomes

- To understand the concept of kinematics.
- To solve the free fall and projectile problems.
- To solve problems in kinematics.

CHAPTER 3 KINEMATICS

Motion in One Dimension

- Displacement, position, velocity, speed and acceleration
- Instantaneous Velocity and Speed
 - Free Fall

Motion in Two Dimension

- Projectile Motion

Kinematics

by Farah Hanani binti Zulkifli

<http://ocw.ump.edu.my/enrol/index.php?id=461>

Position, displacement, velocity, speed & acceleration

Position

- ▶ A point where an object is located with respect to its reference or origin in a coordinate system.

Kinematics

by Farah Hanani binti Zullkifli

<http://ocw.ump.edu.my/enrol/index.php?id=461>

Position, displacement, velocity, speed & acceleration

Displacement

- ▶ Is the changes of position, Δx in a specified time interval.

$$\Delta x \equiv x_f - x_i$$

Where

- x_f is final position
 - x_i is initial position
- ▶ The value can be +ve or -ve

Kinematics

by Farah Hanani binti Zullkifli

<http://ocw.ump.edu.my/enrol/index.php?id=461>

How that the displacement value be positive or negative?

Positive

Negative

Kinematics

by Farah Hanani binti Zullkifli

<http://ocw.ump.edu.my/enrol/index.php?id=461>

Example

- ▶ Ali walking 70m towards east and then make a U-turn at a distance of 30m to the west. Calculate the total distance and displacement for his journey.

- ▶ Total distance = 100 m
- ▶ Displacement = 40 m

Speed & Velocity

- ▶ **Speed** quantify a measurement of a distance travelled by an object at specific interval time.

$$\text{Speed} = \frac{\text{Distance}}{\text{Time Interval}}$$

- ▶ **Velocity** measure how fast an object is moving with respect to its magnitude and direction.

$$\text{Velocity} = \frac{\text{Displacement}}{\text{Time Interval}}$$

$$v_{x,avg} \equiv \frac{\Delta x}{\Delta t} = \frac{x_f - x_i}{\Delta t}$$

Kinematics

by Farah Hanani binti Zullkifli

<http://ocw.ump.edu.my/enrol/index.php?id=461>

Position, displacement, velocity, speed & acceleration

• Acceleration

- ▶ **Acceleration** is the change of velocity.

$$\text{Acceleration} = \frac{\text{Velocity}}{\text{Time Interval}}$$

- ▶ **Average acceleration** is the change of velocity at a specified time interval.

$$a_{x,avg} \equiv \frac{\Delta v_x}{\Delta t} = \frac{v_{xf} - v_{xi}}{t_f - t_i}$$

- ▶ SI Unit for acceleration is ms^{-2}

Kinematics

by Farah Hanani binti Zullkifli

<http://ocw.ump.edu.my/enrol/index.php?id=461>

Instantaneous Velocity

- ▶ Shows the velocity of a moving object at one point along a path distance.

Graph of particle's position vs. time

- ▶ By refer to above graph, the tangent to the curve (at any point) is denote to the instantaneous velocity.

- ▶ The instantaneous velocity could be expressed as:

$$v_x = \lim_{\Delta t \rightarrow 0} \frac{\Delta x}{\Delta t} = \frac{dx}{dt}$$

- ▶ The value can be +ve, -ve or zero.
- ▶ Meanwhile, the **instantaneous speed** is the magnitude of the instantaneous velocity w/o considered its direction.

Kinematics

by Farah Hanani binti Zullkifli

<http://ocw.ump.edu.my/enrol/index.php?id=461>

Instantaneous Acceleration

- ▶ The **instantaneous acceleration** is the average acceleration of an object as the time interval approaches zero.

$$a = \lim_{\Delta t \rightarrow 0} \frac{\Delta v}{\Delta t} = \frac{dv}{dt}.$$

Kinematics

by Farah Hanani binti Zullkifli

<http://ocw.ump.edu.my/enrol/index.php?id=461>

- ▶ Both velocity as well as acceleration is a rate in which expressed in terms of time.
- ▶ Therefore, instantaneous acc. can be expressed as:

$$a = \frac{dv}{dt} = \frac{d}{dt} \left(\frac{dx}{dt} \right) = \frac{d^2 x}{dt^2}$$

Kinematics

by Farah Hanani binti Zulkifli

<http://ocw.ump.edu.my/enrol/index.php?id=461>

Freely Falling Object

- Objects is said to be **fall freely** when near the Earth's surface with constant acceleration.
- Galileo Galilei (1564-1642) stated that in the absence of air (due to small resistance effect), all objects fall with the same acceleration.
- This is due to the gravity, g which is equal to 9.81 ms^{-2}

Kinematics

by Farah Hanani binti Zullkifli

<http://ocw.ump.edu.my/enrol/index.php?id=461>

When dealing with freely falling object, we can make use of kinematics equation for constant acceleration

$$v = v_0 + at$$
$$x = x_0 + v_0 t + \frac{1}{2} at^2$$
$$v^2 = v_0^2 + 2a(x - x_0)$$
$$\bar{v} = \frac{v + v_0}{2}$$

- $a = g = 9.80 \text{ ms}^{-2}$
- If the motion is vertical, substitute y in x , y_0 in x_0 , $y_0 = 0$ (unless specified)
- v_0 is initial velocity, x_0 is initial position = y_0

1st case: An object dropped

- The initial velocity, $v_o = \text{zero}$.
- Let the **downward** be **+ve**.
- Refer to kinematic equations:
 - Since the motion is vertical, use y instead of x since.
 - $a_y = g = 9.81 \text{ m/s}^2$

$$v_o = 0$$

$$a = g$$

Kinematics

by Farah Hanani binti Zullkifli

<http://ocw.ump.edu.my/enrol/index.php?id=461>

2nd situation- An object thrown downward

- $a_y = g = 9.81 \text{ m/s}^2$
- Initial velocity $\neq 0$
- With the **downward** be **+ve**.

$$v_o \neq 0$$

$$v_o = +ve$$

$$a = g$$

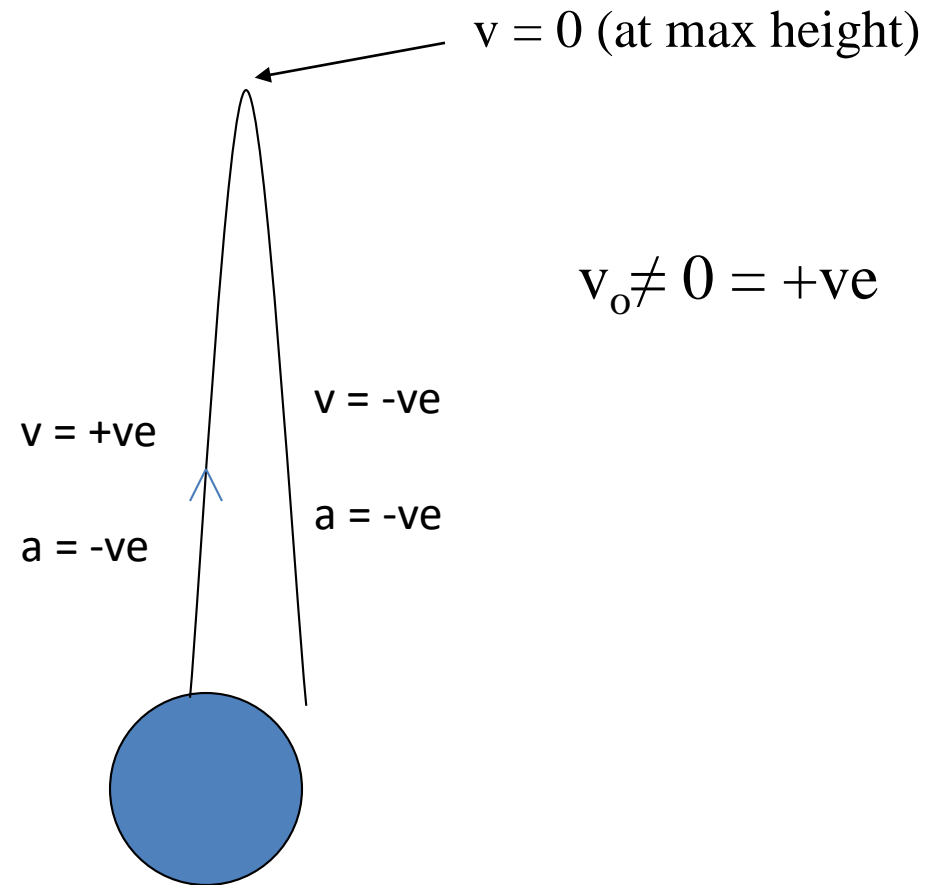

Kinematics

by Farah Hanani binti Zullkifli

<http://ocw.ump.edu.my/enrol/index.php?id=461>

3rd situation : an object **thrown upward**

- Let direction be **positive** at any point **above** the release point and **negative** at any point **below** the release point
- The initial velocity is moving upward \rightarrow so +ve
- The instantaneous velocity at the max. height, $h = \text{zero}$
- Pay attention , the $a_y = -g = -9.81 \text{ m/s}^2$ in the whole motion.

See you in Next Chapter!
