Newton's Law

by Farah Hanani binti Zulkifli

<http://ocw.ump.edu.my/enrol/index.php?id=461>

Chapter Description

- Expected Outcomes
 - To solve physics's problems by apply the Newton's Law in the horizontal, vertical and along a slope motion.
- References
 - Young, H.D. & Freeman, R.A. University Physics with Modern Physics (14th Ed.) Pearson, 2015

Force

- Force, F (“push” or “pull”) : interaction between object-object or object-environment.
- It is a vector quantity. (involving **magnitude & direction**)
- Unit of F is Newton (N) or kgms^{-2}

Newton's Law

by Farah Hanani binti Zulkifli

<http://ocw.ump.edu.my/enrol/index.php?id=461>

Types of forces

1. Normal force — An object in rests on the surface always have a force push back. (directed perpendicular)
2. Frictional forces — motion along the surface can be resist the frictional forces. (directed parallel)

(a) **Normal force \vec{n}** : When an object rests or pushes on a surface, the surface exerts a push on it that is directed perpendicular to the surface.

(b) **Friction force \vec{f}** : In addition to the normal force, a surface may exert a frictional force on an object, directed parallel to the surface.

Newton's Law

by Farah Hanani binti Zulkifli

<http://ocw.ump.edu.my/enrol/index.php?id=461>

3. Tension forces — Force exerted on an object through cable or cord is called tension.

4. Weight — The pull of gravity on an object.

(c) **Tension force \vec{T}** : A pulling force exerted on an object by a rope, cord, etc.

(d) **Weight \vec{w}** : The pull of gravity on an object is a long-range force (a force that acts over a distance).

Newton's 1st Law

- An object at rest remains at rest while an object in motion remains in constant motion in a straight line unless there is a force acted on the object (no resultant force).
- Also known as Inertia.

Newton's Law

by Farah Hanani binti Zulkifli

<http://ocw.ump.edu.my/enrol/index.php?id=461>

Newton's 2nd Law

- If there is a resultant force acts on an object, the object will move or experience acceleration (if the object in motion).
- The direction of a is always in the direction of $F_{\text{resultant}}$.
- Knowing that, $a \propto F/m$
- So , $F = ma$

Newton's Law

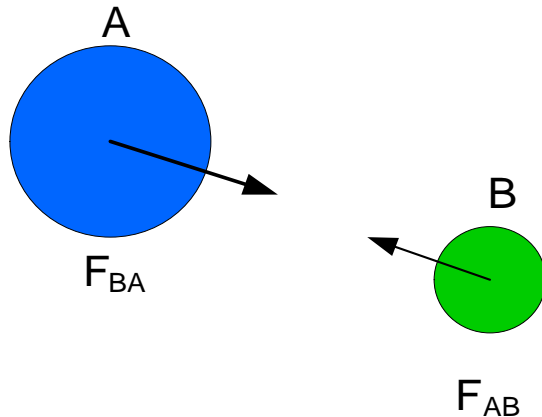

by Farah Hanani binti Zulkifli

<http://ocw.ump.edu.my/enrol/index.php?id=461>

Newton's 3rd Law

- Each action force have an equal and opposite reaction force.
- **Known as action-reaction pair.**

$$\mathbf{F}_{BA} = - \mathbf{F}_{AB}$$

Free Body Diagram

- Simplified sketch of a system.
- Method:
 1. Draw a simple sketch of the body/object.
 2. Draw all the possible forces acting on the object.
 3. Label each force by considered its magnitude and direction.

Newton's Law

by Farah Hanani binti Zulkifli

<http://ocw.ump.edu.my/enrol/index.php?id=461>

Remember!

For case involving **TENSION** (in rope/cable/cord) and **SPRING** force:

- In free-body diagram, the direction of tension force must be **AWAY** from the subject focus.

Newton's Law

by Farah Hanani binti Zulkifli

<http://ocw.ump.edu.my/enrol/index.php?id=461>

Inclined plane

Normal forces are always directed perpendicular to the surface.

- There are two forces (gravitational and normal) that acted on the object that is positioned on an inclined plane.
- Gravitational force: downward direction, $F_{||} = mg \sin \theta$, $F_{\perp} = mg \cos \theta$
- Normal force: upward direction
- Frictional force will acted in the opposite direction of motion.

Newton's Law

by Farah Hanani binti Zulkifli

<http://ocw.ump.edu.my/enrol/index.php?id=461>

Forces of friction

- Force that resist the motion of material in contact with surface.
- Frictional force, $F_{fr} = \mu F_N$

Where,

F = Pull or push force that cause the motion on the object

F_N = normal force

W = Weight of the object

μ = Friction's coefficient
