Roots of Equation

By Raihana Edros

<http://ocw.ump.edu.my/course/view.php?id=608&notifieditingon=1>

# Chapter Description

- Aims
  - Apply numerical methods in solving engineering problem and optimisation
- Expected Outcomes
  - Calculate the root of equation by using bracketing methods
    - Graphical Method
    - Bisection Method
    - False-Position Method
- References
  - Steven C. Chapra and Raymond P. Canale (2009), Numerical Methods for Engineers, McGraw-Hill, 6<sup>th</sup> Edition

Roots of Equation

By Raihana Edros

<http://ocw.ump.edu.my/course/view.php?id=608&notifieditingon=1>

# If you were given....

$$f(x) = ax^2 + bx + c = 0$$

$$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$$

The value of  $x$  calculated are called the “roots” of equation.

The roots of equation is the value of  $x$  that makes  $f(x)=0$ .

But?

$$\sin x + x = 0 \Rightarrow x = ?$$

Roots of Equation

By Raihana Edros

<http://ocw.ump.edu.my/course/view.php?id=608&notifieditingon=1>

# How numerical methods work to solve the roots of equation?

Hence, approximate solution can be one of the alternatives.

2 kinds of approaches:

- 1) Plot the function and determine where it crosses the  $x$  axis, ( $f(x)=0$ ).
- 2) Guessing a value of  $x$  and evaluate whether  $f(x)$  is zero.

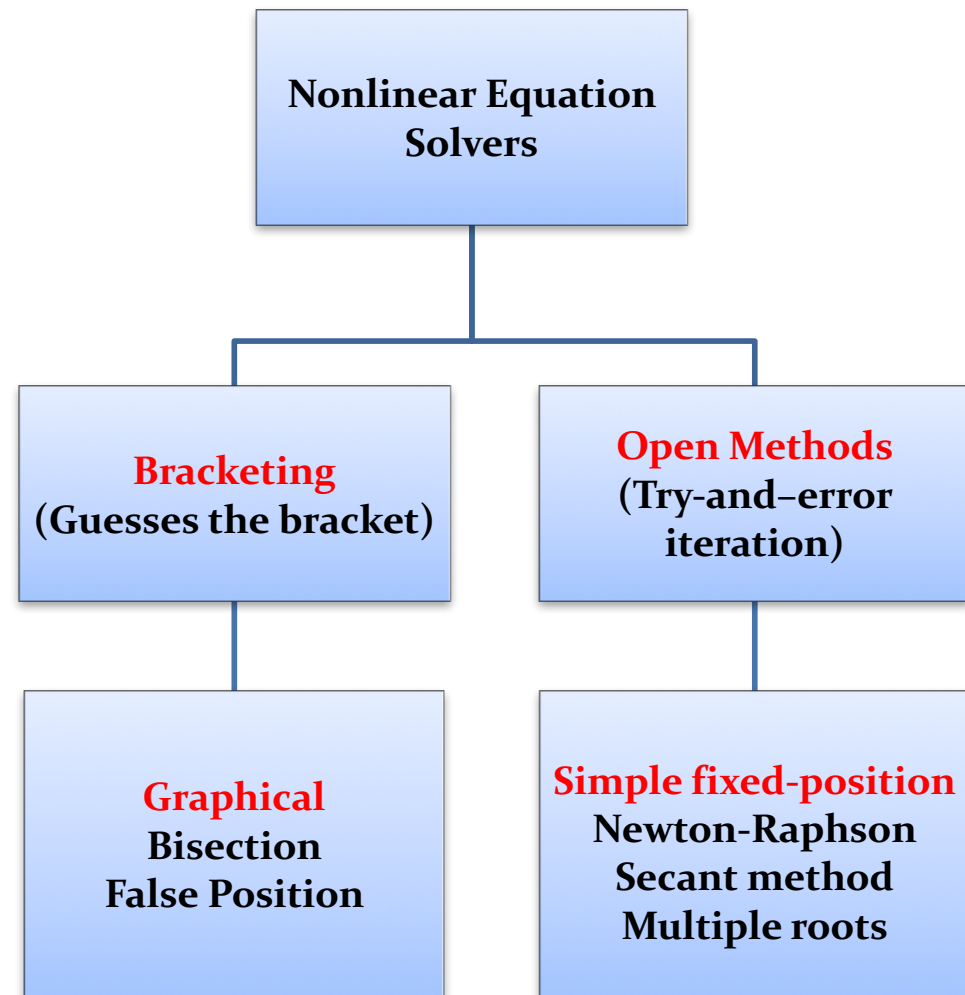

Roots of Equation

By Raihana Edros

<http://ocw.ump.edu.my/course/view.php?id=608&notifieditingon=1>

# Methods to determine roots of equation

- Bracketing methods  
(two initial guesses for the root are required)
  - a) Graphical method
  - b) Bisection method
  - c) False position method
- Open methods
  - a) Simple Fixed-Iteration method
  - b) Newton-Raphson Method
  - c) The secant Method

Roots of Equation

By Raihana Edros

<http://ocw.ump.edu.my/course/view.php?id=608&notifieditingon=1>

# Bracketing method

- Two initial guesses for the root are required.
- These guesses must be in “bracket” or be on either side of the root.
- **Graphical method**
  - Plot the function  $f(x)$  and observe the value of  $x$  where  $f(x)=0$ .
  - Rough estimation

Roots of Equation

By Raihana Edros

<http://ocw.ump.edu.my/course/view.php?id=608&notifyeditingon=1>

# Graphical Method: Example 1

Use graphical approach to determine the drag coefficient  $c$  needed.

$$f(c) = \frac{667.38}{c} (1 - e^{-0.146843c}) - 40$$

Substitute various values of  $c$  into the right hand side of this eqn to compute  $f(c)$

# Bisection Method

- Bisection method is called as binary chopping where the interval is divided in half.
- The root is obtained by halving the initial guesses.
- This is then repeated to refine the estimates of the roots.
- If the  $f(x)$  change sign (+ve, -ve), the function value at the midpoint is evaluated.

# Simple algorithm for The Bisection Method

**Step 1:** Choose lower ( $x_l$ ) and upper ( $x_u$ ) for the root such that the function changes sign over the interval. This can be checked by ensuring that  $f(x_l)f(x_u) < 0$ .

**Step 2:** Estimate the root by evaluating

$$x_r = \frac{x_l + x_u}{2}$$

**Step 3:** make the following evaluation to determine in which subinterval the roots lies:

Find the pair:

- If  $f(x_l)f(x_r) < 0$ , root lies in the **lower interval**, then  $x_u = x_r$  and go to step 2.
- If  $f(x_l)f(x_r) > 0$ , root lies in the **upper interval**, then  $x_l = x_r$ , go to step 2.
- If  $f(x_l)f(x_r) = 0$ , then root is  $x_r$  and terminate.

# The Bisection Method: Example

- Use bisection method to solve the same problem as in the previous example (Graphical Method) with  $\epsilon_s=0.5\%$ .
- The first step in bisection method is to guess two values of the unknown ( $x_l$  and  $x_u$ ) where the function changes.
- From the graph we can see that,  $f(c)$  changes sign between 12 and 16.
- Step 1:  $x_l=12$ ,  $x_u =16$ . Estimate the root  $x_r$ :
- Step 2: 1st iteration for  $x_r=14$
- >> Continue calculation till termination criteria is met.

Roots of Equation

By Raihana Edros

<http://ocw.ump.edu.my/course/view.php?id=608&notifyeditingon=1>

# The Bisection Method: Example

Iteration	$x_l$	$x_u$	$x_r$	$\epsilon_a$ (%)	$\epsilon_t$ (%)
1	12	16	14		5.279
2	14	16	15	6.667	1.487
3	14	15	14.5	3.448	1.896
4	14.5	15	14.75	1.695	0.204
5	14.75	15	14.875	0.840	0.641
6	14.75	14.875	14.8125	0.422	0.219

<http://ocw.ump.edu.my/course/view.php?id=608&notifieditingon=1>

# The False-Position Method

- If  $f(x_l)$  is much close to zero than  $f(x_u)$ , it is likely that the root is closer to  $x_l$  than  $x_u$ .
- Join this  $f(x_l)$  and  $f(x_u)$  by a straight line to get the intersection on  $x$ -axis which represent the  $x_r$  value.
- Also called as linear interpolation method.

Source: [https://de.wikipedia.org/wiki/Datei:False\\_position\\_method.svg](https://de.wikipedia.org/wiki/Datei:False_position_method.svg)

# Steps of The False-Position Method

1. Find the values of  $x_l$  and  $x_u$  These values are evaluated using:
2. Compute the  $x_r$  using:

$$x_r = x_u - \frac{f(x_u)(x_l - x_u)}{f(x_l) - f(x_u)} \quad f(x_l)f(x_u) < 0$$

3. a) If  $f(x_l)f(x_r) < 0$ , root lies in the lower interval, then determine  $x_u = x_r$  and go to step 2.  
b) If  $f(x_l)f(x_r) > 0$ , root lies in the upper interval, then  $x_l = x_r$ , go to step 2.  
c) If  $f(x_l)f(x_r) = 0$ , then root is  $x_r$  and terminate.

Roots of Equation

By Raihana Edros

<http://ocw.ump.edu.my/course/view.php?id=608&notifieditingon=1>

# Steps of The False-Position Method

4. Compute  $\mathcal{E}_a$

$$\mathcal{E}_a = \left| \frac{x_r^{new} - x_r^{old}}{x_r^{new}} \right| \times 100\%$$

5. Calculation can be terminated when  $\mathcal{E}_a$  is lower than the given  $\mathcal{E}_s$ .

# The False-Position Method: Example

Use the false-position method to determine the root of the same equation investigated in Example 1.

*(Initiate the calculation with guesses of  $x_l = 12$  and  $x_u = 16$ ).*

Roots of Equation

By Raihana Edros

<http://ocw.ump.edu.my/course/view.php?id=608&notifieditingon=1>

# The False-Position Method: Example

Given

$$f(x) = -25 + 82x - 90x^2 + 44x^3 - 8x^4 + 0.7x^5$$

Using initial guesses of  $x_l=0.5$  and  $x_u=1.0$ , determine the root using:

- Bisection method to  $\varepsilon_s = 10\%$
- False-position method to  $\varepsilon_s = 0.2\%$

Roots of Equation

By Raihana Edros

<http://ocw.ump.edu.my/course/view.php?id=608&notifieditingon=1>

# Conclusion

- The root of equation can be estimated by using bracketing methods such as graphical, bisection and false-position methods.
