# Example 1

- Calculate the volumetric displacement for a gear pump. Given the inside diameter, outside diameter and the gear width is 40 mm, 65 mm and 20 mm respectively.

# Example 1: Solution

- $D_i = 40 \times 10^{-3} \text{ m}$
- $D_o = 65 \times 10^{-3} \text{ m}$
- $L = 20 \times 10^{-3} \text{ m}$

$$V_D = \frac{\pi}{4} L (D_o^2 - D_i^2)$$
$$V_D = \frac{\pi}{4} (65 \times 10^{-3})^2 - (40 \times 10^{-3})^2 \times 20 \times 10^{-3}$$
$$V_D = 4.124 \text{e-}5 \text{ m}^3/\text{rev}$$

## Example 2

- A geometrical volume for an ideal gear pump is  $12.5 \text{ cm}^3$ . This pump delivers the fluid at 16 MPa and run at 1800 rpm. The pump inlet pressure is 200 kPa. Calculate:
  - Pump flow rate,  $Q_t$
  - Fluid power increment,  $\Delta N$
  - Output hydraulic power,  $N_{out}$ ,
  - Driving torque,  $T_t$

## Example 2: Solution

$$Q_t = V_g n = 12.5 \times 10^{-6} \times (1800/60) = 3.75 \times 10^{-4} \text{ m}^3/\text{s}$$

$$\begin{aligned} \Delta N &= Q_t \Delta P = 37.5 \times 10^{-5} \times (16 \times 10^6 - 2 \times 10^5) \\ &= 5925 \text{ W} \end{aligned}$$

$$N_{\text{out}} = Q_t P = 37.5 \times 10^{-5} \times 16 \times 10^6 = 6000 \text{ W}$$

$$\begin{aligned} T_t &= (Vg/2\pi) \Delta P = (12.5 \times 10^{-6}/2\pi) \times (16 \times 10^6 - \\ &2 \times 10^5) \\ &= 31.4 \text{ Nm} \end{aligned}$$

## Example 3

- A leakage of oil from a pump is 6% at 230 bar. Calculate the total efficiency if the flow rate at 0 bar is  $10 \text{ dm}^3\text{min}^{-1}$  and the motor efficiency is 75%.
- Solution:

$$Q (P = 0 \text{ bar}) = 10 \text{ dm}^3\text{min}^{-1}$$

$$Q (P = 230 \text{ bar}) = 10 \times 0.94 = 9.4 \text{ dm}^3\text{min}^{-1}$$

$$\eta_{motor} = 0.75, \eta_{vol} = 9.4/10 = 0.94$$

Therefore

$$\eta_{tot} = \eta_{motor} \times \eta_{vol} = 0.705 (= 70.5 \%)$$

## Example 4

- A displacement volume for a positive displacement pump is  $100 \text{ cm}^3$ . The pump flow rate is  $0.0015 \text{ m}^3/\text{s}$  at 1000 rpm and 70 bars. If the input torque of the pump motor is 120 Nm, calculate:
  - a) Overall efficiency of the pump?
  - b) Theoretical torque required to operate the pump?

## Example 4: Solution

- a) From  $Q_T = V \times n$ ,

$$\text{Given } V = 100 \text{ cm}^3/\text{rev}$$

$$= 0.0001 \text{ m}^3/\text{rev}$$

$$Q_T = V \times n$$

$$= 0.0001 \text{ m}^3/\text{rev} \times (1000/60 \text{ revs}^{-1})$$

$$= 0.00167 \text{ m}^3/\text{s}$$

## Example 4: Solution

- Solve volumetric efficiency

$$\begin{aligned}\eta_{\text{vol}} &= Q_A/Q_T \\ &= 0.0015/0.00167 = 0.898 = 89.8\%\end{aligned}$$

Solve mechanical efficiency

$$\begin{aligned}\eta_m &= PQ_T/T_A N \\ &= (70 \times 10^5)(0.00167)/(120)(1000 \times \\ &\quad (2\pi/60)) \\ &= 0.93 = 93\%\end{aligned}$$

$$\text{Therefore, } \eta_{\text{tot}} = 0.93 \times 0.898 = 0.835 = 83.5\%$$

## Example 4: Solution

- b)  $\eta_m = T_T / T_A$

$$T_T = \eta_m \times T_A = 0.93 \times 120 = 112 \text{ Nm}$$
