Exercise 1

Determine the force required to accelerate

- (a) a 1000-kg steel block at $\frac{1}{2} g$;
- (b) a 200-g dragon fruit at the same rate.

(4905 N, 0.981 N)

Newton's Law of Motion

Exercise 2

- 1) A resultant force of 29 N act in an easterly direction on a 75 kg mass. What is the resulting acceleration?
- 2) In an experiment aboard a space shuttle, an astronaut observes that a resultant force of only 12 N will give a steel box on an acceleration of 4 m/s^2 . Calculate the mass of the box.

(0.387 m/s^2 , 3 kg)

Exercise 3

A system of two solid iron suspended over a pulley by a flexible wire is sometimes referred to as an Atwood's Pulley. If mass one is 10.00 kg and mass two is 5.00 kg, determine the acceleration of each mass.

(3.27 m/s²)

Exercise 4

A 3.70×10^3 kg elevator is being raised by a cable that exerts a 4.00×10^4 N force upwards. Determine the acceleration of the elevator.

(1.001 m/s²)
